NATURAL SCIENCE

The natural sciences include biology, chemistry, physics, earth sciences, and space sciences—the study of substances, processes, and interactions of matter and energy. To succeed in any of the natural sciences, students need to display an intellectual curiosity about the natural world. Students will cultivate strong critical thinking and analytical skills along with the ability to work independently and as part of a team. These classes are designed to develop knowledge about the scientific origins of the earth and its place in the universe and to provide valuable laboratory experience.
